1 Introduction

This report provides the analysis and overview of the noise modeling data preparation and resulting contours for the calendar year 2023 at Miami International Airport (MIA). The Federal Aviation Administration's (FAA's) Aviation Environmental Design Tool version 3f (AEDT) was used to develop the Day-Night Average Sound Level (DNL) contours for the calendar year 2023. These contours were compared to the MIA 2019 noise contours that were previously modeled using the AEDT 3c.

The MIA 2023 noise contours were prepared using aircraft activity information from calendar year 2023. Information was gathered from Miami-Dade Aviation Department's (MDAD's) Airport Noise and Operations Monitoring System (ANOMS) and the FAA's Operations Network (OPSNET). A detailed discussion of the model inputs used to develop these contours is included in the following sections.

2 Aircraft Operations and Fleet Mix

ANOMS data provided information for noise contour development including the date, time of day, operation type (departure or arrival), runway used, flight and/or tail number, aircraft type, airline, and destination/origin for operations occurring at MIA. The ANOMS system recorded a total of 457,140 airport operations in 2023 while the FAA's OPSNET data, which reflect operations counts collected by MIA air traffic controllers, reported 461,792 airport operations at MIA during the same timeframe.¹

While the ANOMS recorded approximately 4,650 operations less than OPSNET, the OPSNET numbers were used for the total operational count in the development of the 2023 noise contours. As a result, the ANOMS fleet data was scaled to the operations reflected in OPSNET. This equates to an average of approximately 1,265 daily operations (defined as either an arrival or departure) at MIA during the calendar year 2023.

Fleet mix defines the various types of aircraft and allows the development of very specific input data, such as engine, airframe, gross weight, and departure stage length for each aircraft. The AEDT aircraft database contains noise and performance data for 300 different types of aircraft and helicopters. The AEDT also has the functionality to allow the modeler to select different airframes and engine types, resulting in a database of over 3,600 unique aircraft. As described above, ANOMS data provided a comprehensive list of aircraft that utilized MIA for the calendar year 2023. The AEDT aircraft database was used to build a fleet mix representative of aircraft in operation at MIA during calendar year 2023. AEDT fleet mix is presented in **Appendix A-1** and **Appendix A-3** for various airport operational parameters, described below.

3 Stage Length

Departure destination information provided by the ANOMS was analyzed to determine departure stage lengths. An aircraft's stage length (or trip length) refers to the distance an aircraft flies from its origin airport (MIA) to its intended destination. Stage length is important in noise modeling since the longer the distance an aircraft will fly to its destination, the greater the fuel load required and overall weight and, as a result, the lower its departure profile will be. **Table 1** provides the trip

¹ <https://aspm.faa.gov/opsnet/sys/airport.asp>, accessed February 16, 2023.

distance to its associated stage length. The stage length information used to develop the MIA 2023 noise contours is included in **Appendix A-1**.

Table 1. Stage Length

Stage Length	Trip Length (nmi)
1	0 – 500
2	500 – 1,000
3	1,000 – 1,500
4	1,500 – 2,500
5	2,500 – 3,500
6	3,500 – 4,500
7	4,500 – 5,500
8	5,500 – 6,500
9	6,500 – 11,000
M	Maximum Range at Maximum Takeoff Weight

4 Time of Day

Day-night use percentages are also included in the development of DNL contours. For the DNL metric, noise events occurring between the hours of 10:00:00 p.m. and 6:59:59 a.m. receive a 10 dB “penalty”. A 10 dB penalty means each nighttime noise event is weighted equivalent to 10 daytime events. This penalty attempts to account for the higher sensitivity to noise in the nighttime and the expected decrease in background noise levels at night in comparison with background noise levels during the day.

MIA has a day and night percentage split of approximately 84.5 percent and 15.5 percent, respectively, for both arrival and departure aircraft, as shown in **Table 2**. A detailed breakdown of time-of-day percentages by AEDT aircraft type are shown in **Appendix A-2** and **Appendix A-3**.

Table 2. Day-Night Arrival and Departure Percentages

	Arrival			Departure		
	Day	Night	Total	Day	Night	Total
Total	192,890	35,252	228,142	193,551	35,447	228,998
Percentage	84.5%	15.5%	100.0%	84.5%	15.5%	100.0%

SOURCE: MDAD ANOMS, 2023; ESA, 2024.

5 Runway Use

The primary factor affecting runway use at airports is weather, in particular the wind direction and wind speed. Additional factors that may affect runway use include the position of the facility or ramp relative to the runways. Some airports have a preferred or preferential runway system that

balances noise concerns with the safest and most efficient use of the airport. If a certain runway is used predominantly for departures while another runway is used for arrivals, the noise contours will differ to reflect this type of activity. **Table 3** shows the runway use percentages by day-night departures and arrivals. The data shows that MIA most commonly operates day and night in an east flow condition utilizing Runways 08L, 08R, 09, and 12 a total of 74.4 percent of the time. This is a result of the strong ocean breezes and the performance needs of aircraft to depart into the wind. Runway 08R has the highest percentage of runway operations at approximately 31.5 percent and is primarily used for departures and nighttime arrivals.

Table 3. 2023 Runway Use

Runway	Arrival		Departure		Overall Runway Use
	Day	Night	Day	Night	
09	38.9%	34.0%	4.9%	12.2%	22.1%
27	1.9%	2.2%	11.4%	11.7%	6.7%
12	18.8%	2.1%	2.9%	1.6%	9.5%
30	10.8%	2.5%	0.1%	0.7%	4.8%
08L	15.2%	10.2%	8.8%	5.8%	11.4%
26R	10.8%	6.1%	2.9%	1.5%	6.4%
08R	1.9%	26.0%	58.2%	52.8%	31.5%
26L	1.5%	16.8%	10.8%	13.6%	7.6%
H1	0.1%	0.0%	0.1%	0.0%	0.1%
Total	100.0%	100.0%	100.0%	100.0%	100.0%

SOURCE: MDAD ANOMS, 2023; ESA, 2024.

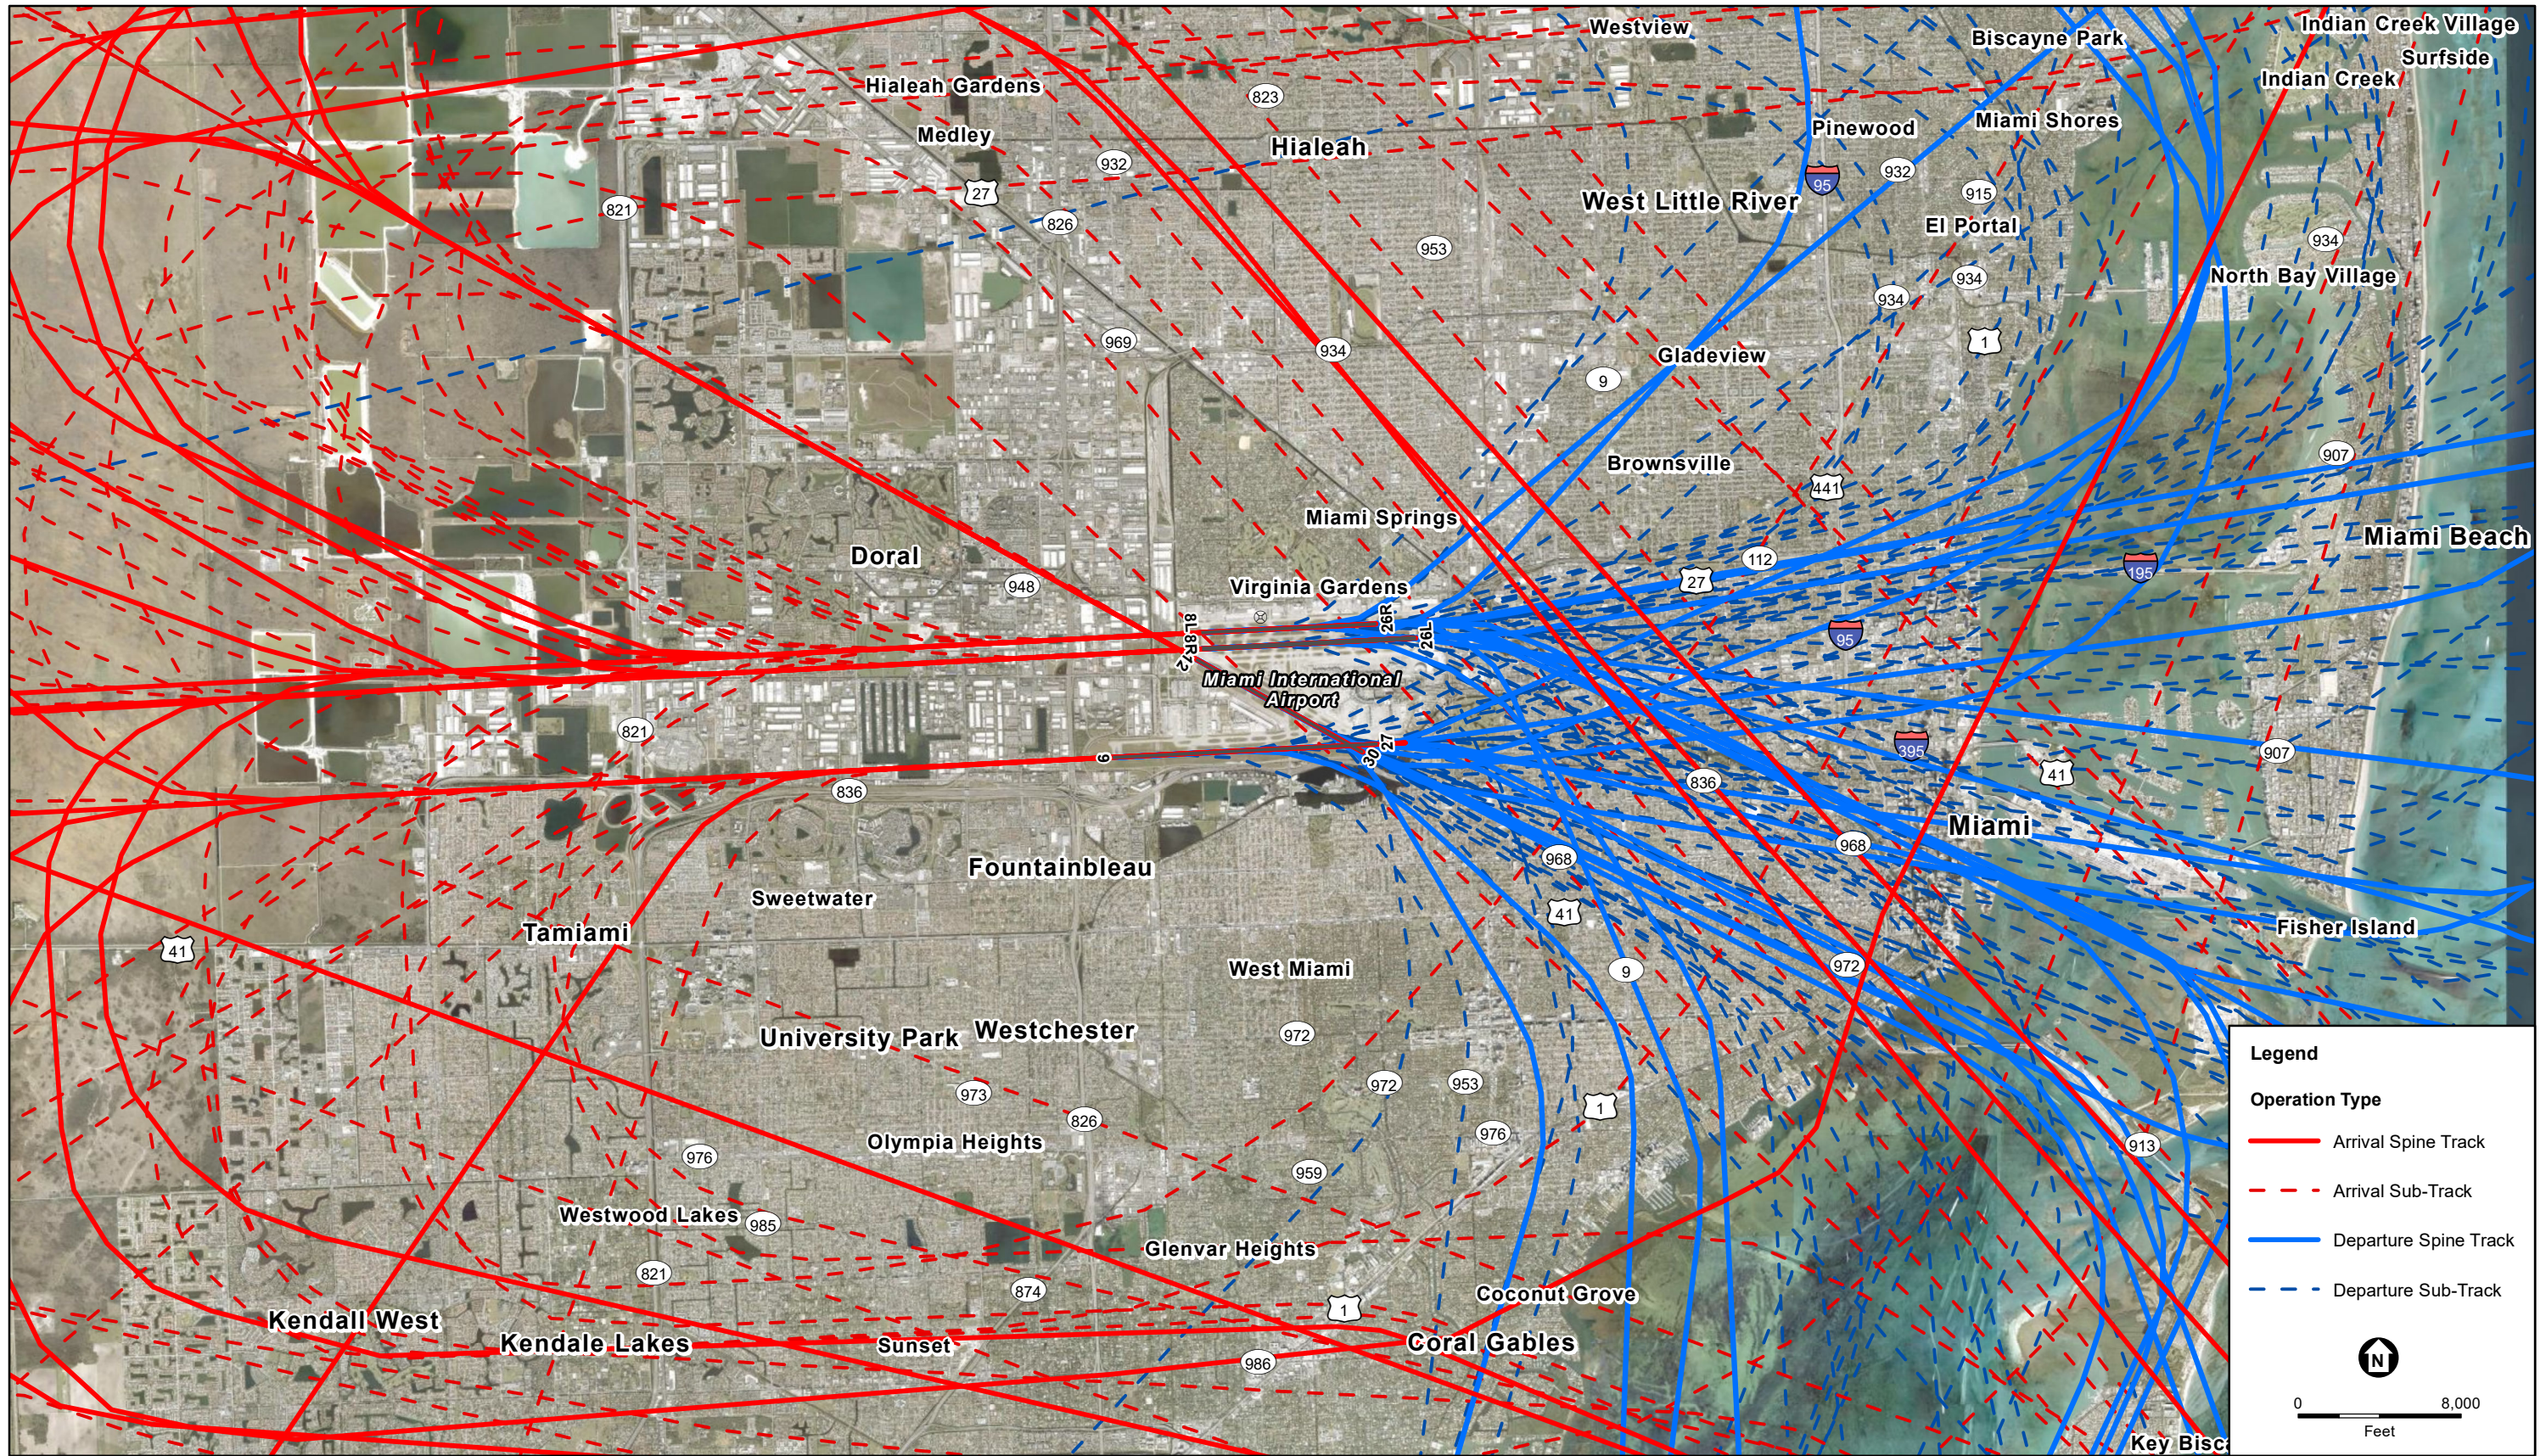

It should be noted that runway use percentages are also influenced by the relationship of where aircraft park on the airport relative to the runway location. MIA has a high number of cargo and general aviation operations in addition to air carrier operations. Most of the general aviation aircraft park on the north side of the airport and are more likely to use Runways 08L-26R and 08R-26L. Cargo aircraft are based at multiple locations on the airport and may use a broader range of runways. This is an important consideration as larger/heavier aircraft are often louder than general aviation aircraft and will have more of an effect on the shape of the noise contours. For this reason, runway use percentages by aircraft category (e.g. narrow-body, wide-body, regional, business jet, etc.) were also determined and used to develop the noise contours. A detailed breakdown of runway use by aircraft category is included in **Appendix A-4**.

Helicopter takeoff and landing locations were consolidated to one location immediately north of Runway 08L-26R because the ANOMS radar tracks indicated the majority of helicopters depart from and arrive to this area. All helicopter takeoff and landing activity was assigned to this location, labeled as H1 throughout Appendix A.

6 Flight Tracks

Flight track and flight track use percentages are a key element in the development of the DNL contours. Radar flight tracks obtained from ANOMS were compared to the 2019 modeled flight tracks and modified as necessary. The flight track use percentages were updated from the 2019 modeling as the metroplex had changed the overall use of the airspace around MIA. Dispersion of

aircraft operations across sub-tracks is presented in **Appendix A-5**. The flight track locations are depicted in **Figure 1** through **Figure 3**.

7 Meteorological Conditions

AEDT has several settings that affect aircraft performance profiles and sound propagation based on meteorological data. Meteorological settings include 10-year average temperature, barometric pressure, and relative humidity at the airport. AEDT includes the following values for annual average weather conditions at MIA:

- Temperature: 77.98° F
- Pressure: 1016.13 millibars
- Sea-level Pressure: 1017.25 millibars
- Relative Humidity 72.26%
- Dew Point: 68.31° F
- Wind Speed: 6.85 Knots

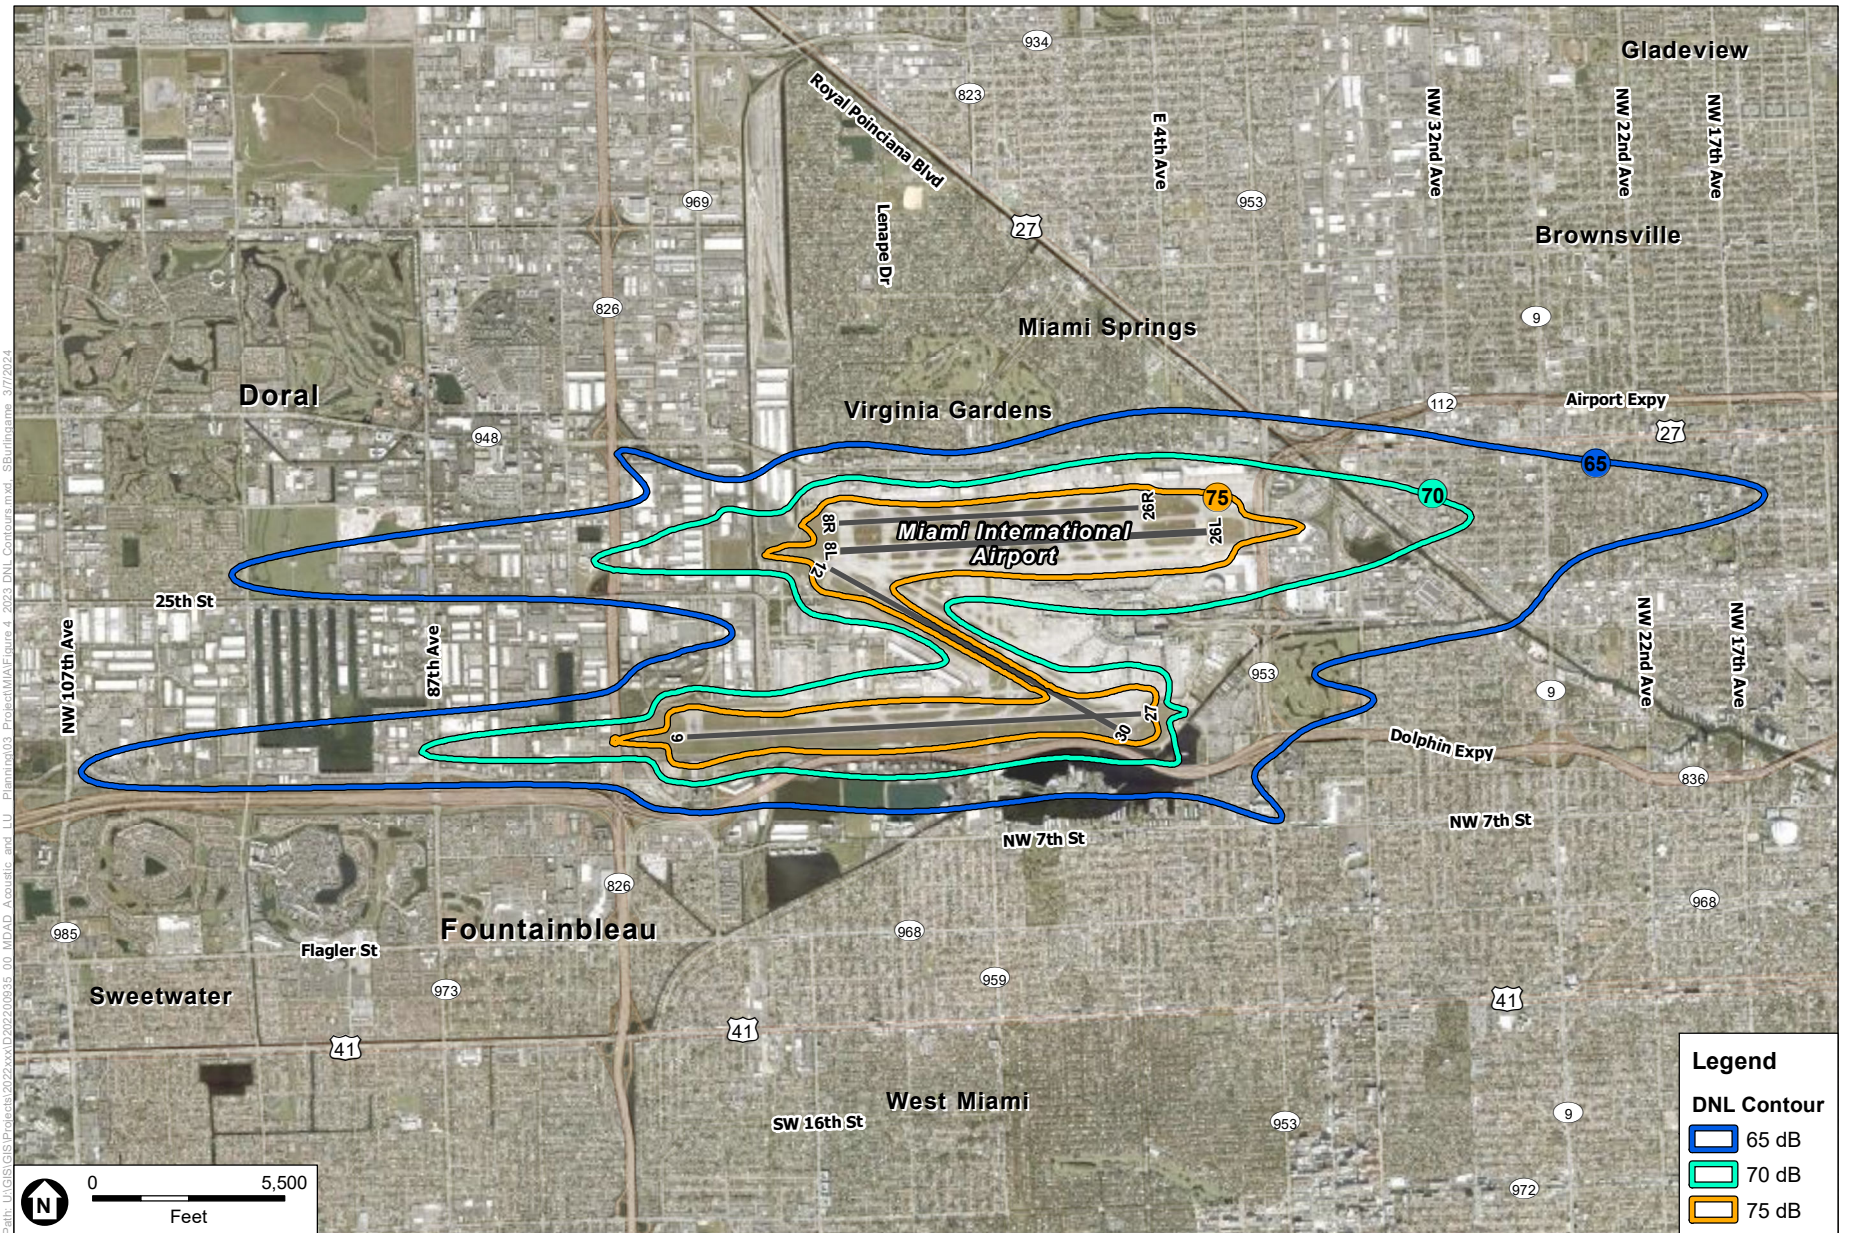

8 Terrain

Terrain data describes the elevation of the ground surrounding the airport and on airport property. If the AEDT user selects the use of terrain data, AEDT uses terrain data to adjust the ground level under the flight paths. The terrain data does not affect the aircraft's performance or noise levels, but does affect the vertical distance between the aircraft and a "receiver" on the ground. This in turn affects how noise propagates over ground. ESA obtained 1/3 arcsecond terrain data from the United States Geological Survey (USGS) National Map Viewer and it was used with the terrain feature of the AEDT in generating the noise contours.²

9 2023 DNL Contours

The information described above was compiled and incorporated into the AEDT. The AEDT calculates noise using a defined network of grid points at ground level around an airport. It computes the noise generated by each aircraft operation, by aircraft type and engine thrust level along each flight track. Corrections are applied for atmospheric acoustical attenuation, acoustical shielding of the aircraft engines by the aircraft itself, and aircraft speed variations. The noise exposure levels for each aircraft are then summed at each grid point. The cumulative noise exposure levels at all grid points are then used to develop noise exposure contours for selected values (e.g. DNL 65, 70 and 75 dB). Using the results of the grid point analysis, noise contours of equal noise exposure can then be plotted. The 2023 MIA noise contours for DNL 65, 70, and 75 dB are shown in **Figure 4**. These contours represent the noise exposure to areas surrounding MIA on an average annual day. The overall shape of the noise contours reflect the east and west orientation of the runways at MIA. The area of the contours in square miles is shown in **Table 4**. Each contour area is inclusive of the subsequent contour areas. Therefore, the cumulative footprint of all three contours is approximately 10.83 square miles.

Miami International Airport CY2023 Noise Contour Update

Figure 4
 2023 DNL Contours

Table 4. 2023 DNL Contour Areas

DNL	Contour Area (Sq. Mi.)
≥ 65	10.83
≥ 70	4.43
≥ 75	1.80

SOURCE: AEDT 3f; ESA 2024.

As stated previously, MIA typically operates in an east flow condition due to the predominant winds at the airport. The narrower more defined contour bands to the west of the airport reflect the influence of the high number of arriving aircraft from the west, while the wider bands of contours to the east reflect the higher number of aircraft departures to the east.

10 2019 and 2023 DNL Contour Comparison

In order to determine the changes in noise exposure that occur over time, it is helpful to compare previous contours to existing contours. With the understanding that the MIA 2023 DNL contours were produced with AEDT 3f and the 2019 DNL contours were produced with AEDT 3c, every effort was made to ensure that the differences in models did not unduly influence the contour shapes.

A comparison of the MIA 2019 and 2023 DNL contours is shown in **Figure 5**. Noise exposure areas of increase and decrease between the MIA DNL 2019 and DNL 2023 are depicted in **Figure 6**. **Table 5** compares the area coverage of 2019 and 2023 contours.

Table 5. DNL Contour Area Comparison

DNL	DNL Contour Area (Sq. Mi.)		
	2023	2019	Difference
≥ 65	10.83	10.72	0.11
≥ 70	4.43	4.33	0.10
≥ 75	1.80	1.80	0.00

SOURCE: AEDT 3f; AEDT 3c; ESA 2024.

As presented in **Table 5**, the 2023 DNL contours are slightly larger than the 2019 DNL contours. **Table 6** compares the aircraft operations during 2019 and 2023. The total number aircraft operations increased by 45,019 (approximately 10%) from 2019 to 2023, which resulted in the increase in area of the DNL 65 by 0.11 square miles.

Table 6. Aircraft Operations Comparison

Year	Arrival		Departure		Total
	Day	Night	Day	Night	
2019	178,007	30,380	175,410	32,976	416,773
2023	195,276	35,620	195,447	35,449	461,792
Difference	17,269	5,241	20,036	2,473	45,019

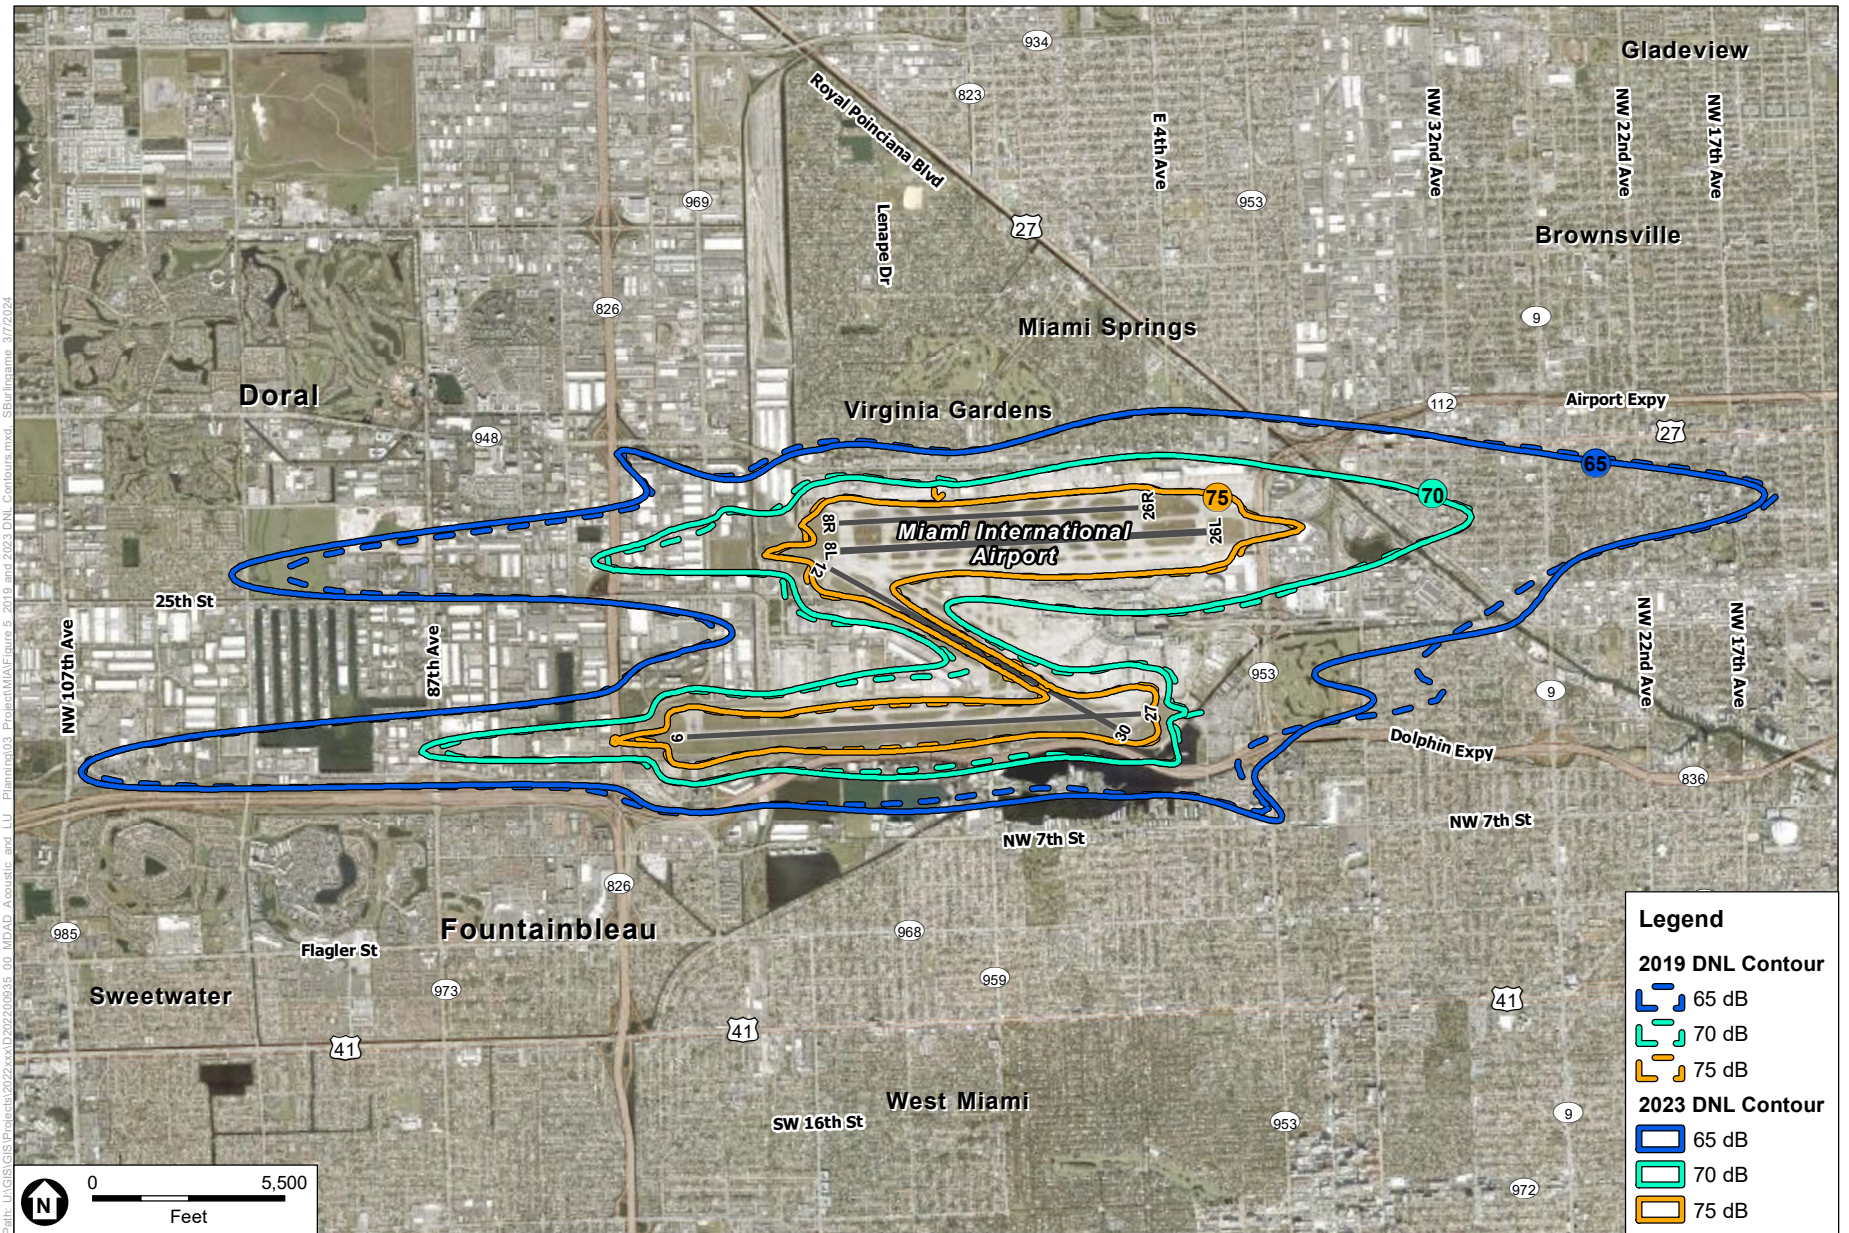

SOURCE: L&B, 2020; MDAD ANOMS, 2023; ESA, 2024.

Table 7 compares overall runway use between 2019 and 2023. As depicted in the table, the use of Runway 08L increased in 2023. This increase is most notable in the arrival lobe shown in **Figure 6**. The increase in Runway 09 arrivals compared to 2019 increased sideline noise south of the airport. The decrease to the east of Runway 27 is attributed to the decrease in nighttime, wide-body aircraft off Runway 9 and overall decrease in arrivals to Runway 27.

Table 7. Overall Runway Use Comparison

Runway	2019	2023	Difference
08L	9.08%	11.54%	2.46%
